

23 June 1964

Dear Gregg,

Attached is your copy of the revised Item VIII, of Exhibit A, Statement of Work for the B-57. As we mutually agreed during our Provisioning Guidance Conference of 8-9 June 1964, this revised Item VIII will be the basis for your planning, preparation, provisioning procedures and actions. The practical effects of this change will markedly reduce the estimated costs of your provisioning planning and documentation effort for this item. This also confirms the requirement for the depot parts repair capability to be located at your plant in lieu of the formerly planned depot capability situated at Beale AFB.

Regards,

Copies to:

Item VIII

A. Special tooling, facilities, or equipment required for production of Items I and III.

B. Special tooling, facilities or equipment required to provide a repair capability through the lowest level of field replaceable elements at the operating location. Production equipment and tooling shall be used to the maximum extent. The field shop equipment provided for Cat. I and Cat. II testing will be the foundation on which this repair capability will be built.

Special tooling, facilities and equipment to provide depot level repair and overhaul at the contractor's plant. Depot level repair is defined as repair of all items of equipment where repair requires equipment and skills not normally found in a base field shop. In general, modules such as printed circuit board, transmitter tubes, motors, etc., will be depot repair items.
